

## **APPENDIX I**

### **MATHEMATICS**

The purpose of this mathematics appendix is twofold; first, it is a refresher for the Seabees who have encountered a time lapse between his or her schooling in mathematics; second, and more important, this section applies mathematics to the tasks that can not be accomplished without the correct use of mathematical equations.

#### **Linear Measurement**

Measurements are most often made in feet (ft) and inches (in). It is necessary that a Seabee know how to make computations involving feet and inches.

##### **Changing Inches to Feet and Inches**

To change inches to feet and inches, divide inches by 12. The quotient will be the number of feet, and the remainder will be inches.

##### **Changing Feet and Inches to Inches**

To change feet and inches to inches, multiply the number of feet by 12 and add the number of inches. The results will be inches.

##### **Changing Inches to Feet in Decimal Form**

To change inches to feet in decimal form, divide the number of inches by 12 and carry the result to the required number of places.

##### **Changing Feet to Inches in Decimal Form**

To change feet in decimal form to inches, multiply the number of feet in decimal form by 12.

##### **Addition of Feet and Inches**

A Seabee often finds it necessary to combine or subtract certain dimensions which are given in feet and inches.

Arrange in columns of feet and inches and add separately. If the answer in the inches column is more than 12, change to feet and inches and combine feet.

##### **Subtraction of Feet and Inches**

Arrange in columns with the number to be subtracted below the other number. If the inches in the lower number are greater, borrow 1 foot (12 Inches) from the feet column in the upper number. Subtract as in any other problem.

##### **Multiplication of Feet and Inches**

Arrange in columns. Multiply each column by the required number. If the inches column is greater than 12, change to feet and inches then add to the number of feet.

## Division of Feet and Inches

In dividing feet and inches by a given number, the problem should be reduced to inches unless the number of feet will divide by the number evenly.

To divide feet and inches by feet and inches, change to inches or feet (decimals).

## Angles

When two lines are drawn in different directions from the same point, an angle is formed.

Angles are of four types:

- Right angle is a  $90^\circ$  angle.
- Acute angles are angles less than  $90^\circ$ .
- Obtuse angles are angles greater than  $90^\circ$ , but less than  $180^\circ$ .
- Reflex angle is an angle greater than  $180^\circ$ .

## Measurement of Angles

Observe that two straight lines have been drawn to form four right angles. Refer to *Figure A-1*.

In order to have a way to measure angles, a system of angle-degrees has been established. Assume that each of the four right angles is divided into 90 equal angles. The measure of each is 1 angle degree; therefore, in the four right angles, there are  $4 \times 90^\circ$ , or 360 angle degrees. For accurate measurement, degrees have been subdivided into minutes and minutes into seconds.

1 degree= 60 minutes (').

1 minute= 60 seconds (").

**Figure A-1 — Right angles.**

## Relationship of Angles

**Figure A-2 — Relationship of angles.**

1.  $\angle ZOY$  and  $\angle ZOX$  are supplementary angles and their total measure in degrees is equal to  $180^\circ$ . When one straight line meets another, two supplementary angles are formed. One is the supplement of the other. Refer to *Figure A-2, View 1*.
2.  $\angle DAC$  and  $\angle CAB$  are complementary angles and their total is a right angle or  $90^\circ$ . Refer to *Figure A-2, View 2*.

Two angles whose sum is  $90^\circ$  are said to be complementary, and one is the complement of the other.

3.  $\angle MOP$  and  $\angle RON$  are a pair of vertical angles and are equal. Refer to *Figure A-2, View 3*.

When two straight lines cross, two pairs of vertical angles are formed. Pairs of vertical angles are equal.

### Bisecting Angles

To bisect an angle merely means to divide the angle into two equal angles. This may be done by use of a compass.

### Perpendicular Lines

Lines are said to be perpendicular when they form a right angle ( $90^\circ$ ).

### Parallel Lines

Two lines are said to be parallel if they are equidistant (equally distant) at all points.

Facts about parallel lines:

Two straight lines lying in the same plane either intersect or are parallel.

Through a point there can be only one parallel drawn to a given line.

If two lines are perpendicular to the third, and in the same plane, they are parallel.

## Plane Shapes

A plane shape is a portion of a plane bounded by straight or curved lines or a combination of the two.

The number of different types of plane shapes is infinite, but we are concerned with those which are of importance to you as a Seabee. We will cover the circle, triangle, quadrilateral, other polygons, and ellipses.

### Circles

Definitions:

A **CIRCLE** is a closed curved line in which any point on the curved line is equidistant from a point called the center. (Circle O). Refer to *Figure A-3*.

A **RADIUS** is a line drawn from the center of a circle to a point on a circle. (As OA, OB, OX, and OY). Refer to *Figure A-3*.

A **DIAMETER** is a line drawn through the center of a circle with its ends lying on the circle. Refer to *Figure A-3*.

A **DIAMETER** is twice the length of a radius. (AB is a diameter of circle O) Refer to *Figure A-3*.

A **CHORD** is a line joining any two points lying on a circle. (CD is a chord of circle O.) Refer to *Figure A-3*.

An **ARC** is a portion of the closed curved lines which forms the circle. It is designated by CD. An arc is said to be subtended by a chord. Chord CD subtends arc CD. Refer to *Figure A-3*.

A **TANGENT** is a straight line which touches the circle at one and only one point. (Line MZ is a tangent to circle O.) Refer to *Figure A-3*.

A **CENTRAL ANGLE** is an angle whose vertex is the center of a circle and whose side are radii of the circle. (As XOY, YOA, and XOB.) Refer to *Figure A-3*.

**CONCENTRIC CIRCLES** are circles having the same center and having different radii.

The **CIRCUMFERENCE** of a circle is the distance around the circle. It is the distance on the curve from C to A to X to Y to B to D and back to C. Refer to *Figure A-3*.

**Figure A-3 — Circle.**

## Triangles

A triangle is a plane shape having 3 sides. Its name is derived from its three (tri) angles.

1. Equilateral - all sides are equal, all angles are equal, and all angles are  $60^\circ$ . Refer to *Figure A-4*.
2. Isosceles - two sides are equal and two angles are equal. Refer to *Figure A-4*.
3. Scalene - all sides are unequal and all angles are unequal. Refer to *Figure A-4*.
4. Right - one right angle is present. Refer to *Figure A-4*.

**Figure A-4 — Types of triangles.**

### Altitudes and Medians

The altitude and median of a triangle are not the same; the difference is pointed out in the following definitions:

1. The altitude of a triangle is a line drawn from the vertex, perpendicular to the base. Refer to *Figure A-5, View 1*.
2. The median of a triangle is a line drawn from the vertex to the midpoint of the base. Refer to *Figure A-5, View 2*.

**Figure A-5 — Altitude and median of a triangle.**

## Construction of Triangles

There are many ways to construct a triangle, depending upon what measurements are known to you. The following definitions will assist you.

1. A triangle may be constructed if the lengths of three sides are known.
2. A triangle may be constructed if two sides and the included angle (angle between the sides) are known.
3. A triangle may be constructed if two angles and the included side are given.
4. A right triangle may be constructed if the two sides adjacent to the right angle are known.
5. A right triangle may be constructed by making the sides 3, 4, and 5 inches or multiples or fractions thereof.

## Quadrilaterals

A quadrilateral is a four-sided plane shape. There are many types, but only the trapezoid, parallelogram, rectangle, and square are described here.

Trapezoid is a quadrilateral having only two sides parallel. If the other two sides are equal, it is an isosceles trapezoid. BF is the altitude of the trapezoid. See *Figure A-6*.

Parallelogram is a quadrilateral having opposite sides parallel. Refer to *Figure A-7*.

1. AB is parallel to CD.
2. AC is parallel to BD.
3. AD and CB are diagonals.
4. Diagonals bisect each other so  $CO = OB$  and  $AO = OD$ .
5. Opposite angles are equal.  $ACD = DBA$  and  $CAB = BDC$ .
6. If two sides of a quadrilateral are equal and parallel, the figure is a parallelogram.
7. A parallelogram may be constructed if two adjoining sides and one angle are known.

Rectangle is a parallelogram having one right angle. Refer to *Figure A-8*.

1. ABCD is a parallelogram having one right angle. This, of course, makes all angles right angles.
2. AC and BD are diagonals.
3. O is the midpoint of AC and BD and  $OB = OC = OD = OA$ .
4. O is equidistant from BC and AD and is also equidistant from AB and CD.
5. A rectangle may be constructed if two adjoining sides are known.

Square is a rectangle having its adjoining sides equal. Refer to *Figure A-9*.

**Figure A-6 —  
Trapezoid.**

**Figure A-7 —  
Parallelogram.**

**Figure A-8 —  
Rectangle.**

1. ABCD is a square.
2. AC and BD are diagonals.
3. O is the geometric center of the square.  $AO = OC = OB = OD$ .
4. O is equidistant from all sides.
5. A square may be constructed if one side is known.

**Figure A-9 — Square.**

### Polygons

A polygon is a many-sided plane shape. It is said to be regular if all sides are equal and irregular when they are not. Only regular polygons are described here.

Triangles and quadrilaterals fit the description of a polygon and have been covered previously. Three other types of regular polygons are shown in *Figure A-10*. Each one is inscribed in a circle. This means that all vertices of the polygon lie on the circumference of the circle.

Note that the sides of each of the inscribed polygons are actually equal chords of the circumscribed circle. Since equal chords subtend equal arcs, by dividing the circumference into an equal number of arcs, a regular polygon may be inscribed in a circle. Also note that the central angles are equal because they intercept equal arcs. This gives a basic rule for the construction of regular polygons inscribed in a circle as follows:

To inscribe a regular polygon in a circle, create equal chords of the circle by dividing the circumference into equal arcs or by dividing the circle into equal central angles.

Dividing a circle into a given number of parts has been discussed, so construction should be no problem. Since there are 360 degrees around the center of the circle, you should have no problem in determining the number of degrees to make each equal central angle.

**Figure A-10 — Types of polygons.**

## Methods for Constructing Polygons

The three methods for constructing polygons described here are the pentagon, hexagon, and octagon.

The Pentagon is developed by dividing the circumference into 5 equal parts.

The Hexagon is developed by dividing the circumference into 6 equal parts.

The Octagon method has been developed by creating central angles of  $90^\circ$  to divide a circle into 4 parts and bisecting each arc to divide the circumference into 8 equal parts.

## Ellipses

An ellipse is a plane shape generated by point P, moving in such a manner that the sum of its distances from two points,  $F_1$  and  $F_2$ , is constant. Refer to *Figure A-11*.

$$BF_1 + PF_2 = C = (\text{a constant})$$

AE is the major axis.

BD is the minor axis.

**Figure A-11 —  
Ellipses.**

## Perimeters and Circumferences

Perimeter and circumference have the same meaning; that is, the distance around. Generally, circumference is applied to a circular object and perimeter to an object bounded by straight lines.

### Perimeter of a Polygon

The perimeter of a triangle, quadrilateral, or any other polygon is actually the sum of the sides.

### Circumference of a Circle

Definition of Pi: Mathematics have established that the relationship of the circumference to the diameter of a circle is a constant called Pi and written as  $\pi$ . The numerical value of this constant is approximately 3.141592653. For our purposes 3.1416 or simply 3.14 will suffice.

The formula for the circumference of a circle is  $C = 2\pi D$  where C is the circumference and D is the diameter since  $D = 2R$  where R is the radius, the formula may be written as  $C = 2\pi R$ .

## Areas

All areas are measured in squares.

The area of a square is the product of two of its sides and since both sides are equal, it may be said to be square of its side.

## NOTE

The area of any plane surface is the measure of the number of squares contained in the object. The unit of measurement is the square of the unit which measures the sides of the square.

## **Area of Rectangle**

$$A = L \times W$$

Where:

A = area of a rectangle

L = length of a rectangle

W = width of a rectangle

## **Area of a Cross Section**

The cross section of an object is a plane figure established by a plane cutting the object at right angles to its axis. The area of this cross section will be the area of the plane figure produced by this cut.

The area of the cross section is  $L \times W$ .

The most common units are square inches, square feet, square yards and in roofing, "squares."

1 square foot = 144 square inches

1 square yard = 9 square feet

1 square of roofing = 100 square feet

## **Common Conversions**

1. To convert square inches to square feet, divide square inches by 144.
2. To convert square feet to square inches, multiply by 144.
3. To convert square feet to square yards, divide by 9.
4. To convert square yards to square feet, multiply by 9.
5. To convert square feet to squares, divide by 100.

## **Conversion of Units of Cubic Measure**

It is often necessary to convert from one cubic measure to another. The conversion factors used are as follows:

1. 1 cubic foot = 1,728 cubic inches
2. 1 cubic yard = 27 cubic feet
3. 1 cubic foot = 7.48 US gallons (liquid measure)
4. 1 us gallon (liquid measure) = 231 cubic inches
5. 1 bushel (dry measure) = 2,150.42 cubic inches

## **Area of a Circle**

The formula for the area of a circle is:

$$A = \pi r^2$$

Where:

A = area of circle

r = radius of circle

$\pi = 3.1416$

Since  $r = d/2$  where  $d$  is the diameter of a circle, the formula for the area of a circle in terms of its diameter is:

$$A = \pi\left(\frac{d}{2}\right)^2 = \frac{\pi d^2}{4}$$

### **Geometric Solids**

In describing plane shapes, you use only two dimensions: width and length; there is no thickness. By adding the third dimension, you describe a solid object.

Consider the solids described below.

**Prism** - is a figure whose two bases are polygons, alike in size and shape, lying in parallel planes and whose lateral edges connect corresponding vertices and are parallel and equal in length. A prism is a right prism if the lateral edge is perpendicular the base. The altitude of a prism is the perpendicular distance between the bases.

**Cone** - is a figure generated by a line moving in such a manner that one end stays fixed at a point called the "vertex." The line constantly touches a plane curve which is the base of the cone. A cone is a circular cone if its base is a circle. A circular cone is a right circular cone if the line generating it is constant in length. The altitude of a cone is the length of a perpendicular to the plane of the base drawn from the vertex.

**Pyramid** - is a figure whose base is a plane shape bounded by straight lines and whose sides are triangular plane shapes connecting the vertex and a line of the base. A regular pyramid is one whose base is a regular polygon and whose vertex lays on a perpendicular to the base at its center. The altitude of a pyramid is the length of a perpendicular to the plane of the base drawn from the vertex.

**Circular Cylinder** - is a figure whose bases are circles lying in parallel planes connected by a curved lateral surface. A right circular cylinder is one whose lateral surface is perpendicular to the base. The altitude of a circular cylinder is the perpendicular distance between the planes of the two bases.

### **Measurement of Volume**

Volume is measured in terms of cubes.

#### **Common Volume Formulas**

All factors in the formulas must be in the same linear units. As an example, one term could not be expressed in feet while other terms are in inches.

#### **Volume of a Rectangular Prism**

$$V = L \times W \times H$$

Where:

$V$  = Volume in cubic inches

$W$  = Width of the base in linear units

$L$  = Length of base in linear units

$H$  = Altitude of the prism in linear units

### Volume of a Cone

$$V = \frac{Axh}{3}$$

Or

$$V = \frac{\pi r^2 h}{3}$$

Or

$$V = \frac{\pi d^2 h}{12}$$

Where:

V= Volume of a cone in cubic units

A = Area of the base in square units

h = Altitude of a cone in linear units

r = Radius of the base

d = Diameter of the base

### Volume of a Pyramid

$$V = \frac{Ah}{3}$$

Where:

V = Volume in cubic units

A = Area of base in square units

h = Altitude in linear units

### Volume of a Cylinder

$$V = Ah$$

Or

$$V = \pi r^2 h$$

Or

$$V = \frac{\pi d^2 h}{4}$$

Where:

V = Volume in cubic units

A = Area of the base in square units

h = Altitude in linear units

r = Radius of the base

d = Diameter of the base

### **Volume of the Frustum of a Right Circular Cone**

The frustum of a cone is formed when a plane is passed parallel to the base of the cone. The frustum is the portion below the plane. The altitude of the frustum is the perpendicular distance between the bases.

$$V = 1/3 \pi h (r^2 + R^2 + Rr)$$

Where:

h = Altitude in linear units

r = Radius of the upper base in linear units

R = Radius of the lower base in linear units

### **Volume of a Frustum of a Regular Pyramid**

A frustum of a pyramid is formed when a plane is passed parallel to the base of the pyramid. The frustum is the portion below the plane. The altitude is the perpendicular distance between the bases.

$$V = 1/3h (B + b + \sqrt{Bb})$$

Where:

V = Volume of the frustum in cubic units

h = Altitude in linear units

B = Area of the lower base in square units

b = Area of the upper base in square units

### **Ratio**

The ratio of one number to another is the quotient of the first, divided by the second. This is often expressed as a:b, which is read as the ratio of a to b. More commonly, this is expressed as the fraction a/b.

Ratio has no meaning unless both terms are expressed in the same unit by measurement.

### **Percentage**

Percentage (%) is a way of expressing the relationship of one number to another. In reality, percentage is a ratio expressed as a fraction in which the denominator is always one hundred.

### **Proportion**

Proportion is a statement of two ratios which are equal.

Example:  $1/3 = 5/15$  or  $1:3 = 5:15$

Solving proportions is done by cross multiplying.

$$\text{Example: } \frac{a}{b} = \frac{c}{d} = a \times d = b \times c$$

## Law of Pythagoras

The Law of Pythagoras is the square of the hypotenuse of a right triangle equals the sum of the two legs. It is expressed by the formula  $a^2 + b^2 = c^2$ .

Right Triangle: a triangle having one right angle

Hypotenuse: The hypotenuse of a right triangle is the side opposite the right angle

Leg: The leg of a right triangle is a side opposite and acute angle of a right triangle.

## METRIC CONVERSION TABLES

### Length Conversion

| When You Know: | You Can Find:  | If You Multiply By: |
|----------------|----------------|---------------------|
|                |                |                     |
| inches         | millimeters    | 25.4                |

## FORMULAS

### Conversion Factors and Constants

$$\begin{aligned}\pi &= 3.14 & 2\pi &= 6.28 \\ \pi^2 &= 9.87 & (2\pi)^2 &= 39.5 \\ \varepsilon &= 2.718 & \sqrt{2} &= 1.414 \\ \sqrt{3} &= 1.732 & \text{LOG} &= 0.497\end{aligned}$$

### Sinusoidal Voltages and Currents

$$\begin{aligned}\text{Effective Value} &= 0.707 \times \text{Peak Value} \\ \text{Average Value} &= 0.637 \times \text{Peak Value} \\ \text{Peak Value} &= 1.414 \times \text{Effective Value} \\ \text{Effective Value} &= 1.11 \times \text{Average Value} \\ \text{Peak Value} &= 1.57 \times \text{Average Value} \\ \text{Average Value} &= 0.9 \times \text{Effective Value}\end{aligned}$$

### Temperature

$$(\text{F to C}) \quad C = 5/9 (F - 32)$$

$$(\text{C to F}) \quad F = 9/5 C + 32$$

$$(\text{C to K}) \quad K = C + 273$$

### Power

$$1 \text{ kilowatt} = 1.341 \text{ horsepower}$$

$$1 \text{ horsepower} = 746 \text{ watts}$$

### Trigonometric Formulas

$$\sin A = \frac{a}{c} = \frac{\text{Opposite Side}}{\text{Hypotenuse}}$$

$$\cos A = \frac{b}{c} = \frac{\text{Adjacent Side}}{\text{Hypotenuse}}$$

$$\tan A = \frac{a}{b} = \frac{\text{Opposite Side}}{\text{Adjacent Side}}$$

$$\cot A = \frac{b}{a} = \frac{\text{Adjacent Side}}{\text{Opposite Side}}$$

**Alternating**  
**Current.**

## Speed vs. Poles Formulas

$$F = \frac{NP}{120} \quad N = \frac{F 120}{P} \quad P = \frac{F 120}{N}$$

F = frequency

N = speed of rotation

P = number of poles

120 = time constant

Power Factor

$$PF = \frac{\text{actual power}}{\text{apparent power}} = \frac{\text{watts}}{\text{volts} \times \text{amperes}} = \frac{\text{kW}}{\text{kVA}} = \frac{R}{Z}$$

## Single-Phase Circuits

$$\text{kVA} = \frac{EI}{1,000} = \frac{\text{kW}}{PF} \quad \text{kW} = \text{kVA} \times PF$$

$$I = \frac{P}{E \times PF} \quad E = \frac{P}{I \times PF} \quad PF = \frac{P}{E \times I}$$

$$P = E \times I \times PF$$

## Two-Phase Circuits

$$I = \frac{P}{2 \times E \times PF} \quad E = \frac{P}{2 \times I \times PF} \quad PF = \frac{P}{E \times I}$$

$$\text{kVA} = \frac{2 \times E \times I}{1,000} \quad \frac{\text{kW}}{PF} \quad \text{kW} = \text{kVA} \times PF$$

$$P = 2 \times E \times I \times PF$$

## Three-Phase Circuits, Balanced Wye

I phase = I line

$$E_L = \sqrt{3} E_P = 1.73 E_P$$

$$E_P = \frac{E_L}{\sqrt{3}} = 0.577 E_L$$

## Three-Phase Circuits, Balanced Wye

E phase = E line

$$I_L = \sqrt{3} I_P = 1.73 I_P$$

$$I_P = \frac{I_L}{\sqrt{3}} = 0.577 I_L$$

## Power: Three-Phase Balanced Wye or Delta Circuits

$$P = 1.732 \times E \times I \times PF \quad VA = 1.732 \times E \times I$$

$$E = \frac{P}{PF \times 1.73 \times I} = \frac{0.577 \times P}{PF \times I}$$

$$I = \frac{P}{PF \times 1.73 \times E} = \frac{0.577 \times P}{PF \times E}$$

$$PF = \frac{P}{PF \times 1.73 \times E} = \frac{0.577 \times P}{I \times E}$$

VA = apparent power (volt-amperes)

P = actual power (watts)

E = line voltage (volts)

I = line current (amperes)

## **WEIGHTS AND MEASURES**

### Dry Measure

2 cups = 1 quart (pt)

2 pints = 1 quart (pt)

4 quarts = 1 gallon (gal)

8 quarts = 1 peck (pk)

4 pecks = 1 bushel (bu)

### Liquid Measure

3 teaspoons (tsp) = 1 tablespoon (tbsp)

16 tablespoons = 1 cup

2 cups = 1 pint

16 fluid ounces (oz) = 1 pint

2 pints = 1 quart

4 quarts = 1 gallon

31.5 gallons = 1 barrel (bbl)

231 cubic inches = 1 gallon

7.48 gallons = 1 cubic foot (cu ft)

### Weight

16 ounces = 1 pound (lb)

2,000 pounds = 1 short ton

2,240 pounds = 1 long ton

### Distance

12 inches = 1 foot (ft)

3 feet = 1 yard (yd)

5-1/2 yards = 1 rod (rd)

16-1/2 feet = 1 rod

1,760 yards = 1 statute mile (mi)

5,280 feet = 1 statute mile

### Area

144 square inches = 1 square foot (sq ft)

9 square feet = 1 square yd (sq yd)

30-  $\frac{1}{4}$  square yards = 1 square rod

160 square rods = 1 acre (A)

640 acres = 1 square mile (sq mi)

### Volume

1,728 cubic inches = 1 cubic foot

27 cubic feet = 1 cubic yard (CU yd)

### Counting Units

12 units = 1 dozen (doz)

12 dozen = 1 gross

144 units = 1 gross

24 sheets = 1 quire

480 sheets = 1 ream

### Equivalents

1 cubic foot of water weighs 62.5 pounds (approx) = 1,000 ounces

1 gallon of water weighs 8- $\frac{1}{3}$  pounds (approx)

1 cubic foot = 7.48 gallons

1 inch = 2.54 centimeters

1 foot = 30.4801 centimeters

1 meter = 39.37 inches

1 liter = 1.05668 quarts (liquid) = 0.90808 quart (dry)

1 nautical mile = 6,080 feet (approx)

1 fathom = 6 feet

1 shot of chain = 15 fathoms

| Area of segment of circle     | = approx $\frac{2}{3}$                 |                                |
| Arc – chord length            | = 0.02 foot per 11 $\frac{1}{2}$ miles |                                |
| Curvature of earth's surface  | = approx. 0.667 foot per mile          |                                |

## APPENDIX II

### Hand Signals

**Emergency Stop**  
Stop all motion as quickly as possible.

**Stop**

**Kill Engine**  
Secure engine as prescribed

**Manuever Forward Slowly**  
When maneuvering in close quarters or to move a foot or two at a time.

Lower Hoist Slowly

Raise Load

Lower Load

Raise Boom

**Raise Boom Slowly**

**Lower Boom and Raise Load**

**Raise Boom and Lower Load**

**Swing In Direction Finger Points**

Close Bucket

Open Bucket

Use Whip Line For Preceding Signals  
(Auxiliary Hoist)  
Tap elbow then use regular signals

Make Left Turn

**Make Right Turn**

**Travel Both Tracks**

**Cut, Fill, or Drag Road**  
Point to road to be dragged or bladed, then rub palms together.  
Applies to scrapers, motor graders, and bulldozers.

**Raise a Little**

**Lower a Little**

**Dump Load Now**  
Start dumping and spreading load to proper depth if given.

**Rehaul or Retract**

**Crowd or Extend**

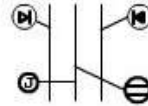

Turn Right (Operator's Right)

Turn Left (Operator's Left)

# APPENDIX III

## COMMON CONSTRUCTION SYMBOLOGY

|  |  |   |

**Qualifying Symbols**  
**Connection Symbol**  
 For use adjacent to other symbols

3-phase, 3-wire, delta

3-phase, 3-wire, delta, grounded

3-phase, 4-wire, delta, grounded

3-phase, open delta

3-phase, wye or star, ungrounded

3-phase, wye, grounded neutral

#### Graphic Symbols for Fundamental Items

**Resistor**

**General**

OR

See Note

Application: adjustable or continuously adjustable (variable) resistor rheostat

OR

See Note

**NOTE:** Always add identification within , or adjacent to, the rectangle.

**Capacitor**

OR

**Antenna**

**General**

Types or functions may be indicated by words or abbreviations adjacent to the symbol.

OR

**Battery**

The long line is always positive, but polarity may be indicated in addition.  
 Example:

**Multicell**

**Thermal Element**

Actuating device, self-heating or with external heater. (Not operated primarily by ambient temperature.)

OR

#### Graphic Symbols for Transmission Path

**Transmission Path**

**Conductor**

**Cable**

**Wiring**

**Guided path, general**

A single line represents the entire group of conditions or the transmission path needed to guide the power or signal.

When required, details of structure, type, impedance, ratings, etc., may be added adjacent to or within any symbol or in a note.

**Busbar (with connections shown)**  
 Use only if essential to distinguish bus from other circuit paths.

OR

**Conductive path or conductor; wire**

**Two conductors or conductive paths**

**Crossing of paths or conductors not connected**

The crossing is not necessarily at a 90° angle.

**Junction of paths or conductors**  
 Junction (if desired)

**Junction of paths, conductors, or cable.**  
 If desired, indicate path type, or size.

**Junction of paths, conductors, or wires**

OR

**2-conductor cable**

**Cable underground; underground line**

OR

These are long dashes

**Overhead line**

## Circuit Return

### Ground general symbol

NOTE: Supplementary information may be added to define the status or purpose of the earth if this is not readily apparent.

(1) A direct conducting connection to the earth or body of water that is a part thereof.

(2) A conducting connect to a structure that serves a function similar to that of an earth ground (that is, a structure such as a frame of an air, space, or land vehicle that is not conductively connected to earth).

Chassis or frame connection, equivalent chassis connection (of printed-wiring boards)

A conducting connection to a chassis of frame (or equivalent chassis connection of a printed-wiring board) may be at substantial potential with respect to the earth or structure in which this chassis or frame (or printed-wiring board) is mounted.

### Graphic Symbols for Contacts, Switches, Contacts, and Relays

## Electrical Contact

Fixed contact for jack, key, relay, switch, etc.

OR

↑ Sleeve

OR

↑ The broken line --- indicates where line connection to a symbol is made and is not part of the symbol.

## Moving Contact

Adjustable or sliding contact for resistor, inductor, etc.

OR

Locking

Nonlocking

## Basic Contact Assemblies

The standard method of showing a contact is by a symbol indicating the circuit condition it produces when the actuating device is in the de-energized or nonoperated position. The actuating device may be of a mechanical, electrical, or other nature, and a clarifying note may be necessary with the symbol to explain the proper point at which the contact functions; for example, the point where a contact closes or opens as a function of changing pressure, level, flow, voltage, current, etc. In cases where it is desirable to show contacts in the energized or operated condition and where confusion may result, a clarifying note shall be added to the drawing.

## Closed contact (break)

OR

OR

## Open contact (make)

OR

OR

## Transfer

OR

OR

## Make-before-break

## Magnetic Blowout Coil

## Operating Coil Relay Coil

OR

OR

OR

\* See Note

## Switch

Fundamental symbols for contacts, mechanical connections, etc., may be used for switch symbols.

### Single-throw, general

### Double-throw, general

### 2-pole double-throw switch with terminals shown

NOTE: The asterisk is not part of the symbol. Always replace the asterisk by a device designation.

### Push button, Momentary or Spring-Return

Circuit closing (make)

Circuit opening (break)

Two-circuit

Selector or Multiposition Switch

The position in which the switch is shown may be indicated by a note or designation of switch position.

General (for power and control diagrams)

Any number of transmission paths may be shown.

OR

Limit Switch Sensitive Switch

NOTE: Identity by LS or other suitable note.

Track-type, circuit-closing contact

Track-type, circuit-opening contact

Flow-Actuated Switch

Closes on increase in flow

Opens on increase in flow

### Liquid-Level-Actuated Switch

Closes on rising level

Opens on rising level

Pressure- or Vacuum-Actuated Switch

Closes on rising pressure

Opens on rising pressure

Temperature-Actuated Switch

Closes on rising temperature

Opens on rising temperature

Thermostat

Closes on rising temperature

\* See Note

Contactor

See also CIRCUIT BREAKER

Fundamental symbols for contacts, coils, mechanical connections, etc., are the basis of contactor symbols and should be used to represent contactors on complete diagrams. Complete diagrams of contactors consist of combinations of fundamental symbols for control coils, mechanical connections, etc., in such configurations as to represent the actual device. Mechanical interlocking should be indicated by notes.

Manually operated 3-pole contactor

NOTE: The t° symbol shall be shown or be replaced by data giving the nominal or specific operating temperature of the device.

### Electrically operated 1-pole contactor with series blowout coil

Electrically operated 3-pole contactor with series blowout coils; 2 open and 1 closed auxiliary contacts (shown smaller than the main contacts)

Relay

Fundamental symbols for contacts, mechanical connections, coils, etc., are the basis of relays on complete diagrams.

The following letter combinations or symbol elements may be used with relay symbols. The requisite number of these letters or symbol elements may be used to show what special features a relay possesses.

AC Alternating-current or ringing relay

D Differential

DB Double-biased (biased in both directions)

DP Dashpot

EP Electrically polarized

FO Fast-operate

FR Fast-release

L Latching

MG Marginal

ML Magnetic-latching (remanent)

NB No bias

NR Nonreactive

P Magnetically polarized using biasing spring, or having magnet bias

SA Slow-operate and slow-release

SO Slow-operate

SR Slow-release

SW Sandwich-wound to improve balance to longitudinal currents

The proper poling for a polarized relay shall be shown by the use of + and - designations applied to the winding leads. The interpretation of this shall be that a voltage applied with the polarity as indicated shall cause the armature to move toward the contact shown nearer the coil on the diagram. If the relay is equipped with numbered terminals, the proper terminal numbers shall also be shown.

Basic

### Relay with transfer contacts

Graphic Symbols for  
Terminals and Connectors

### Terminals

#### Circuit terminal

Terminal board or terminal strip, with 4 terminals shown; group of 4 terminals

Number and arrangement as convenient.

NOTE: Internal lines and terminals may be omitted if terminal identifications are shown within the symbol.

### Cable Termination

Line shown on left of symbol indicates cable.

### Connector Disconnecting Device Jack Plug

The contact symbol is not an arrowhead. It is larger and the lines are drawn at a 90-degree angle.

Female contact

Male contact

### Receptacle or jack (usually stationary)

NOTE: The asterisk is not part of the symbol. If desired, indicate the type of contacts: male (→) or female (←).

### Plug (usually movable) OR

### Separable connectors (engaged)

Engaged 4-conductor connectors; the plug has 1 male and 3 female contacts with individual contact designations shown in the complete-symbol column

### Communication switchboard-type connector

2-conductor (jack)

2-conductor (plug)

### Graphic Symbols for Transformers, Inductors, and Windings

#### Core

#### General or air core

If it is necessary to identify an air core, a note should appear adjacent to the symbol of the inductor or transformer

NO SYMBOL

Magnetic core of inductor or transformer

Not to be used unless it is necessary to identify a magnetic core.

### Inductor

Winding (machine or transformer)

Reactor

Radio-Frequency Coil

Telephone Retardation Coil

See also OPERATING COIL

#### General

Magnetic-core inductor

Telephone loading coil

If necessary to show a magnetic core.

Tapped

Adjustable inductor

Transformer

General

Shielded transformer with magnetic core shown

One winding with adjustable inductance

Adjustable mutual inductor;  
constant-current transformer

Autotransformer, 1-phase

3-phase induction voltage regulator

1-phase, 2-winding transformer

3-phase bank of 1-phase, 2-winding transformers with wye-delta connections

These phases transformer with 4 taps with wye-wye connections

Polyphase transformer

1-phase, 3-winding transformer

Current transformer(s)

Avoid conflict with symbol for loaded line if used on the same diagram.

Bushing-type current transformer

Potential transformer(s)

Outdoor metering device

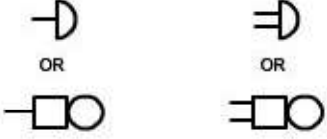

Graphic Symbols for Circuit Protectors

Fuse (one-time thermal current-over-load device)

General

| LED | Light-emitting diode |

## Fluorescent lamp

### 2-terminal

### 4-terminal

## Incandescent lamp (incandescent-filament illuminating lamp)

## Ballast lamp; ballast tube

The primary characteristic of the element within the circle is designed to vary non-linearity with the temperature of the element.

## Visual-Signaling Device

### Annunciator (general)

### Annunciator drop or signal, shutter or grid type

### Annunciator drop or signal, ball type

### Manually restored drop

### Electrically restored drop

### Communication switchboard-type lamp; indicating lamp

### Indicating, pilot, signaling, or switchboard light; indicator light signal light

If confusion with other circular symbols may occur, the D-shape symbol should be used.

OR

## Jeweled signal light

## Graphic Symbols for Readout Devices

### Meter Instrument

NOTE: The asterisk is not part of the symbol. Always replace the asterisk by one of the following letter combinations, depending on the function of the meter or instrument, unless some other identification is provided in the circle and explained on the diagram.

|               |  |
|---------------|--|
| A             | Ammeter                                      |
| AH            | Ampere-hour meter                            |
| C             | Coulombmeter                                 |
| CMA           | Contact-making (or breaking) ammeter         |
| CMC           | Contact-making (or breaking) clock           |
| CMV           | Contact-making (or breaking) voltmeter       |
| CRO           | Oscilloscope                                 |

# Galvanometer

## Graphic Symbols for Rotating Machinery

### Rotating Machine

#### Basic

#### Generator (general)

Avoid conflict with symbols for galvanometer if used on the same diagram.

OR

#### Generator, direct-current

#### Generator, alternating-current

#### Motor (general)

OR

#### Motor, direct-current

#### Motor, alternating-current

### Winding Connection Symbols

Motor and generator winding connection symbols may be shown in the basic circle using the following representations.

#### 1-phase

#### 2-phase

### 3-phase wye (ungrounded)

### 3-phase wye (grounded)

### 3-phase delta

### Alternating-Current Machines

Squirrel-cage induction motor or generator, split-phase induction motor or generator, rotary phase converter, or repulsion motor

Wound-rotor induction motor, synchronous induction motor, induction generator, or induction frequency converter

### 1-phase shaded-pole motor

### 1-phase repulsion-start induction motor

### 3-phase regulating machine

### Alternating-Current Machines with Direct-Current Field Excitation

#### Synchronous motor, generator, or condenserv

## Graphic Symbols for Mechanical Functions

### Mechanical Connection

#### Mechanical Interlock

#### Mechanical connection

The top symbol consists of short dashes.

NOTE: The short parallel lines should be used only where there is insufficient space for the short dashes in series

### Mechanical Motion

#### Translation, one direction

#### Translation, both directions

#### Rotation, one direction

Application: angular motion, applied to open contact (make), symbol

NOTE: The asterisk is not part of the symbol. Explanatory information (similar to type shown) may be added if necessary to explain circuit operation.

#### Rotation, both directions

#### Alternating or reciprocating

#### Rotation designation (applied to a resistor)

CW indicates position of adjustable contact at the limit of clockwise travel viewed from knob or actuator end unless otherwise indicated.

NOTE: The asterisk is not part of the symbol. Always add identification within or adjacent to the rectangle.

Manual Control

General

Operated by pushing

Operated by pushing and pulling (push-pull)

Graphic Symbols for Composite Assemblies

Circuit Assembly

Circuit Subassembly

Circuit Element

NOTE: The asterisk is not part of the symbol. Always indicate the type of apparatus by appropriate words or letters.

NOTE: The use of a general circuit-element symbol is restricted to the following:

- Diagrams drawn in block form.
- A substitute for complex circuit elements when the internal operation of the circuit element is not important of the purpose of the diagram.

General

Accepted abbreviations from ANSI Z32.13-1950 may be used in the rectangle.

The following letter combinations may be used in the rectangle:

CLK Clock  
EQ Equalizer  
FAX Facsimile set  
FL Filter

IND Indicator  
PS Power supply  
RG Recording unit  
RU Reproducing unit  
DIAL Telephone dial  
TEL Telephone station  
TPR Teleprinter  
TTY Teletypewriter

Amplifier

General

The triangle is pointed in the direction of transmission.

The symbol represents any method of amplification (electron tube, solid-state device, magnetic device, etc).

NOTE: If identification, electrical values, location data, and similar information must be noted within symbol, the size or aspect ratio of the original symbol may be altered providing its distinctive shape is retained.

Amplifier use may be indicated in the triangle by words, standard abbreviations, or a letter combination from the following list:

BOG Bridging  
BST Booster  
CMP Compression  
EXP Direct-current  
LIM Limiting  
MON Monitoring  
PGM Program  
PRE Preliminary  
PWR Power  
TRQ Torque

Application: amplifier with associated power supply

General

NOTE: Triangle points in direction of forward (easy) current as indicated by a direct-current ammeter, unless otherwise noted adjacent to the symbol. Electron flow is in the opposite direction.

NOTE: This symbol represents any method of rectification (electron tube, solid-state device, electrochemical device, etc).

Controlled

Bridge-type rectifier

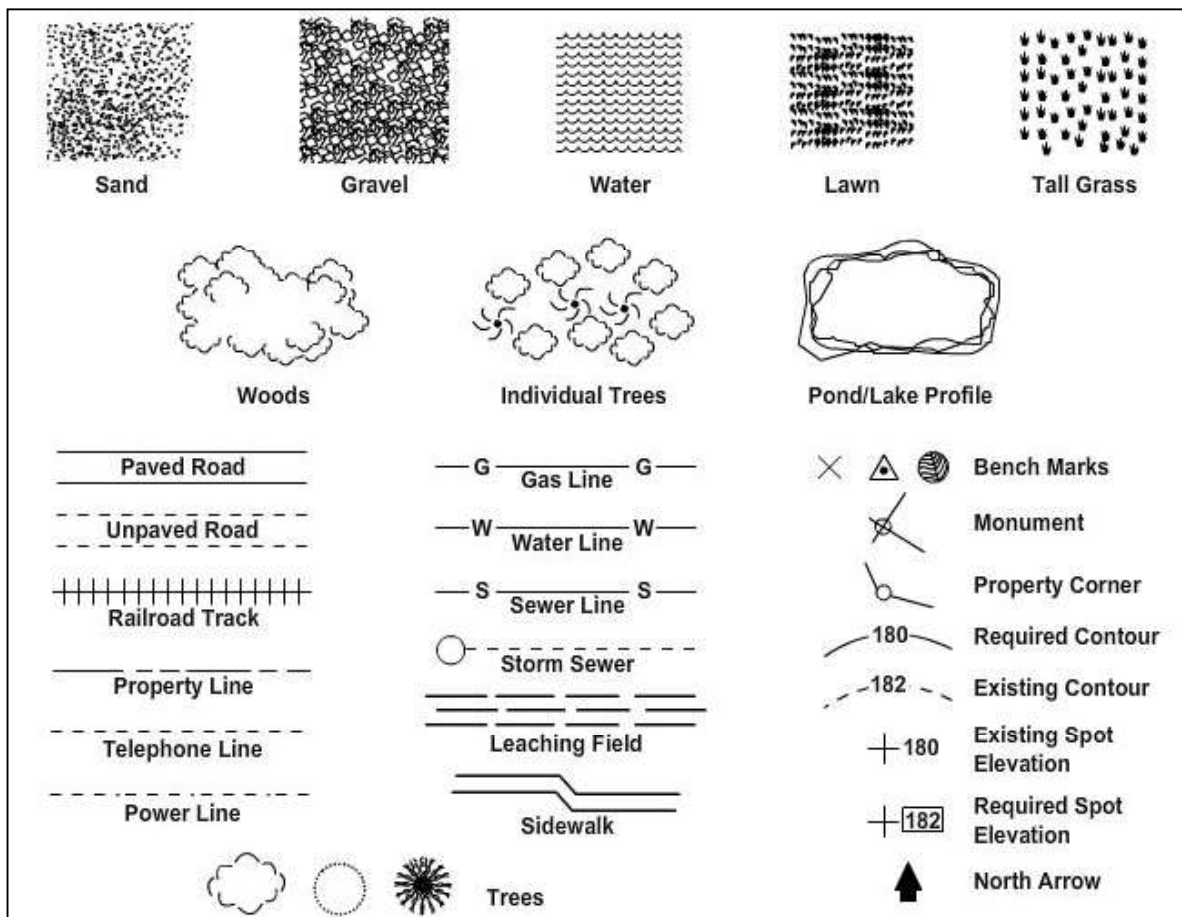

On connection or wiring diagrams, rectifier may be shown with terminals and polarity marking. Heavy line may be used to indicate nameplate or positive-polarity end.

For connection or wiring diagram

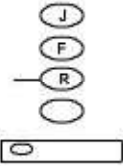

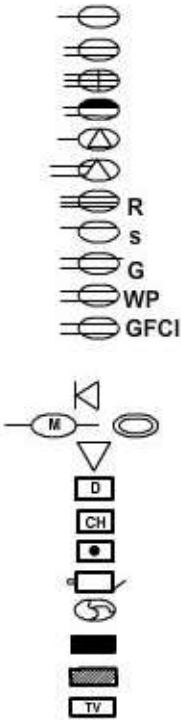

| Description   | Example | Symbol | Illustrated Use   |
|---|---------|--------|---|
| <b>W- Shape (Wide Flange)</b>                             |         | W      | W24 x 78  |

|            | Where process abbreviations are to be included in the tail of the welding symbol, reference is made to Table 1. Designation of Welding and Allied Processes by Letters, of AWS A2.4-86. |

**Location of Elements of a Welding Symbol**

Finish symbol

Groove angle, included angle of countersink for plug welds

Length of weld

Pitch (center-to-center spacing) of welds

Field weld symbols

Arrow connecting reference line to arrow side member of joint or arrow side of joint

Weld-all-around symbol

Reference line

Number of spot, stud, or projection welds

Elements in this area remain as shown when tail and arrow are reversed

Basic weld symbol or detail reference

Specification, process, or other reference

Depth of preparation; size and strength for certain welds

Groove weld size

Root opening: depth of filling for plug and slot welds

Contour symbol

Finish symbol

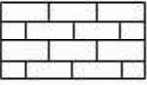

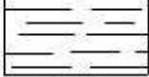

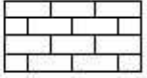

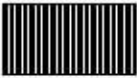

Other Side

Arrow Side

Both Sides

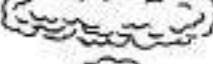

(N)

Tail (Tail omitted when reference is not used)
