Configuring IPsec Virtual Private Networks

The recent NSA publication “Securing IPsec Virtual Private Networks” [1] lays out the importance of IP Security (IPsec) Virtual Private Networks (VPNs) and outlines specific recommendations for securing those connections. It is critical that VPNs use strong cryptography. This guidance goes deeper, providing device administrators specific implementation instructions and example configurations.1

Maintaining a secure VPN tunnel can be complex and requires regular maintenance. To maintain a secure VPN, network administrators should perform the following tasks on a regular basis:

- Reduce the VPN gateway attack surface
- Verify that cryptographic algorithms are Committee on National Security Systems Policy (CNSSP) 15-compliant
- Avoid using default VPN settings
- Remove unused or non-compliant cryptography suites
- Apply vendor-provided updates (i.e. patches) for VPN gateways and clients

Reduce the VPN gateway attack surface

VPN gateways tend to be directly accessible from the Internet and are prone to network scanning, brute force attacks, and zero-day vulnerabilities. To mitigate many of these vulnerabilities, network administrators should implement strict traffic filtering rules:

- Restrict all traffic to the VPN gateway, limiting access to only UDP port 500, UDP port 4500, and ESP.
- When possible, limit accepted traffic to known VPN peer IP addresses. Remote access VPNs present the issue of the remote peer IP address being unknown and therefore it cannot be added to a static filtering rule.
- If traffic cannot be filtered to a specific IP address, NSA recommends an Intrusion Prevention System (IPS) in front of the VPN gateway to monitor for undesired IPsec traffic and inspect IPsec session negotiations.

Examples of recommended ACLs and IPS signatures for obsolete or anomalous VPN traffic are in Appendices A and D.

Verify only CNSSP 15-compliant algorithms are in use

All IPsec VPN configurations require at least two items: (1) the Internet Security Association and Key Management Protocol (ISAKMP) or Internet Key Exchange (IKE) policy; and (2) the IPsec policy. These policies determine how an IPsec tunnel will negotiate phase 1 and phase 2 respectively when establishing the tunnel. If either of these phases is configured to allow obsolete cryptography, the entire VPN will be at risk, and data confidentiality may be lost.

When configuring ISAKMP/IKE, many vendors support having several possible ISAKMP/IKE policies. The device is then trusted to choose the strongest matching policy between the remote and local ends of the VPN. Some vendors do this through priority numbers and others through explicit selection. NSA recommends only configuring policies that meet the minimum level of security and removing any legacy policies. Also, if priority numbers are used, the strongest ISAKMP/IKE policy should be the highest priority (for many vendors a priority of “1” is the highest priority). Each ISAKMP/IKE policy includes at least three key components. These components are the Diffie-Hellman algorithm/group, encryption algorithm, and hashing algorithm.

The following is an example of the minimum recommended ISAKMP/IKE settings per CNSSP 15 as of June 2020 [2]:

- Diffie-Hellman Group: 16
- Encryption: AES-256
- Hash: SHA-384

1 For proprietary application layer VPN best practices, refer to NSA’s Cybersecurity Advisory “Mitigating Recent VPN Vulnerabilities.”
Many vendors also support configuring multiple IPsec policies; however, these policies are normally explicitly configured for a specific VPN. NSA recommends utilizing the strongest cryptography suites supported by the network device. Similar to ISAKMP/IKE, the IPsec policy contains three key components: (1) the encryption algorithm; (2) hashing algorithm; and (3) the block cipher mode. The following is an example of the minimum recommended IPsec settings per CNSSP 15 as of June 2020 [2]:

- Encryption: AES-256
- Hash: SHA-384
- Block Cipher Mode: CBC

Configuration examples for recommended ISAKMP/IKE and IPsec policies on several common vendor devices are included in Appendix B.

The best way to verify that existing VPN configurations are utilizing approved cryptographic algorithms is to review the current ISAKMP/IKE and IPsec security associations (SAs). Appendix C provides a set of common vendor commands to show the current SAs and which cryptographic algorithms were negotiated.

NSA recommends using this approach when reviewing ISAKMP/IKE and IPsec configurations because it will display the exact cryptography settings that were negotiated. On the other hand, if this approach is not followed, reviewing a device’s configuration file may miss where a device is selecting a non-compliant algorithm that was a device default or left over from a previous VPN configuration.

If SAs are identified with non-compliant algorithms, administrators should immediately investigate why the VPN negotiated a lower cryptography standard and make appropriate configuration changes. Also, if pre-shared keys are being used for VPN authentication, NSA recommends that all keys be replaced as they may have been compromised due to the use of weak cryptography.

Many organizations can detect or even block the use of certain common outdated cryptographic algorithms in IPsec, such as the Data Encryption Standard (DES), Triple DES (3DES), and Diffie-Hellman groups 1, 2, and 5, within their networks using an IPS. NSA has also observed related scanning activity that includes anomalous ISAKMP packets, which most networks should be able to block without affecting normal VPN traffic. IPS signatures for some common obsolete cryptographic algorithms and the anomalous packets are provided in Appendix D.

Cryptography standards continue to change over time as the computing environment evolves and new weaknesses in algorithms are identified. Administrators should prepare for cryptographic agility and periodically check CNSSP and NIST guidance for the latest cryptography requirements, standards, and recommendations.

**Avoid using default settings**

Due to the complexity of establishing a VPN, many vendors provide default configurations, automated configuration scripts, or graphical user interface wizards to aid in the deployment of VPNs. These tools take care of setting up the various aspects of a VPN to include ISAKMP/IKE and IPsec policies. However, many will configure a wide range of cryptography suites to ensure compatibility with the remote side of a VPN.

NSA recommends that administrators avoid using these tools as they may allow more than the desired cryptography suites. If these tools are used, then be sure to evaluate all configuration settings that the tool deployed. Administrators should then remove any non-compliant ISAKMP/IKE and IPsec policies. As a best practice, administrators should not utilize any default settings and ensure that all ISAKMP/IKE and IPsec policies are explicitly configured for the CNSSP 15-compliant algorithms.

**Remove unused or non-compliant cryptography suites**

As previously described, many vendors support having several ISAKMP/IKE and IPsec policies configured on a single device. It is also very common for vendors to include extra ISAKMP/IKE and IPsec policies for compatibility by default or when using automatic configuration tools; however, these extra policies may include non-compliant cryptographic
algorithms. Leaving extra ISAKMP/IKE and IPsec policies as acceptable ISAKMP/IKE and IPsec policies creates a vulnerability known as a downgrade attack. This type of attack is where a malicious user or Man-in-the-Middle only offers weak cryptography suites and forces the VPN endpoints to negotiate non-compliant cryptography suites.

Negotiating non-compliant cryptography leaves the encrypted VPN vulnerable to exploitation, including potential decryption, data modification, and adversarial system access. To mitigate this vulnerability, administrators should validate that only compliant ISAKMP/IKE and IPsec policies are configured and all unused or non-compliant policies are explicitly removed from the configuration. NSA also recommends periodically validating that only compliant policies are configured as the use of automated tools, graphical interfaces, or user error could reintroduce non-compliant policies.

Apply vendor-provided updates

After ensuring that all configuration settings are utilizing compliant cryptography suites and that all non-compliant suites are removed, a robust patch management procedure must be implemented. Over the past several years, multiple vulnerabilities have been released related to IPsec VPNs. Many of these vulnerabilities are only mitigated by applying vendor-provided patches. Applying patches to VPN gateways and clients needs to be a part of a regular routine. In addition, it provides a mechanism to receive alerts when new major vulnerabilities are released. Many network equipment vendors allow customers to sign up for notification emails of new security alerts. These notifications are an excellent way to stay up-to-date on relevant out-of-cycle patches.

Conclusion

VPNs are essential for enabling remote access and connecting remote sites securely. However, without the proper configuration, patch management, and hardening, VPNs are vulnerable to many different types of attacks. To ensure that the confidentiality and integrity of a VPN is protected, reduce the VPN gateway attack surface, always use CNSSP 15-compliant cryptography suites, avoid using vendor defaults, disable all other cryptography suites, and apply patches in a timely manner. Following the steps identified in this paper will ensure the most secure VPN configurations.

Appendix A: Reducing VPN Gateway Attack Surface Examples

**ACL Examples to Limit ISAKMP Traffic to Only Known Peers**

**Cisco ASA®2:**

Access-list deny-ike extended permit udp <source_peer_ip> <destination_peer_ip> eq isakmp
Access-list deny-ike extended permit udp <source_peer_ip> <destination_peer_ip> eq 4500
Access-list deny-ike extended permit esp <source_peer_ip> <destination_peer_ip>
Access-list deny-ike extended deny udp any <destination_peer_ip> eq isakmp
Access-list deny-ike extended deny esp any <destination_peer_ip> eq 4500

**Juniper SRX®3:**

[edit security policies from-zone untrust to-zone trust]
Policy <permit-policy-name> {
  Match {
    source-address <source-peer-ip>;
    destination-address <destination-peer-ip>;
    Application [junos-ike junos-ike-nat];
  }
  Then {
    Permit;
  }
}
Policy <deny-policy-name> {
  Match {
    source-address any
    destination-address <destination-peer-ip>;
    Application [junos-ike junos-ike-nat];
  }
  Then {
    deny;
  }
}

**Palo Alto Firewalls:**

[edit rulebase security]
Security {
  Rules
    <permit-rule-name> {
      From untrust;
      To trust;
      Source <source-peer-ip>;
      Destination <destination-peer-ip>;

**IPS Signature Examples to Restrict Protocols That Are Not Used**

Reducing the attack surface can include restricting protocols that are not in use. If IKEv1 or IKEv2 is not used at all, then the following rules can be used to block all IKEv1 or IKEv2 traffic. If IKEv1 or IKEv2 is used, do not use the corresponding rule or else legitimate traffic will be blocked.

**Block all IKEv1 traffic (only use for devices that do not use any IKEv1)**

```
alert udp any any -> any [500,4500] (msg:"All IKEv1"; content:"|00 00 00 00 00 00 00 00 01 10 02 00 00 00 00 |"; offset: 8; sid:1; rev:1;)
```

**Block all IKEv2 traffic (only use for devices that do not use any IKEv2)**

```
alert udp any any -> any [500,4500] (msg:"All IKEv2"; content:"|00 00 00 00 00 00 00 00 21 20 22 08 00 00 00 00 |"; offset: 8; sid:2; rev:1;)
```
Appendix B: ISAKMP/IKE and IPsec Configuration Examples

In an effort to provide clear guidance on implementing strong IPsec VPNs, this document includes examples of the ISAKMP/IKE and IPsec, also known as phase 1 and 2, configurations for multiple vendors and devices. When deploying a remote access IPsec VPN, administrators must also ensure that all VPN clients are also configured properly. For further guidance on deploying VPNs on specific devices or VPN clients, appropriate vendor documentation should be followed.

**CISCO IOS ROUTERS®**

**ISAKMP:**

**IKEv1:**

```plaintext
crypto isakmp policy 1
encryption aes 256
group [16|20]
hash [sha384|sha512]
```

**IKEv2:**

```plaintext
crypto ikev2 proposal <proposal name>
encryption aes-cbc-256
integrity [sha384|sha512]
group [16|20]
```

**IPsec:**

```plaintext
crypto ipsec transform-set <transform name> esp-256-aes [esp-sha-hmac|esp-sha384-hmac|esp-sha512-hmac]
```

**CISCO ASA**

**ISAKMP:**

For Cisco ASA devices, NSA recommends IKEv2, since the IKEv1 implementation only supports SHA1.

**IKEv2:**

```plaintext
crypto ikev2 policy 1
encryption [aes-256|aes-gcm-256]
integrity [sha384|sha512]
group [16|20]
```

**IPsec:**

```plaintext
crypto ipsec ikev2 ipsec-proposal <proposal name>
protocol esp encryption [aes-256|aes-gcm-256]
protocol esp integrity [sha-384|sha512]
```

**Juniper SRX**

**ISAKMP/IKEv1 and IKEv2:**

```plaintext
[edit security ike]
proposal ike-proposal {
   dh-group [group16|group20];
   authentication-algorithm [sha-384|sha512]
```
encryption-algorithm [aes-256-cbc|aes-256-gcm]
}

policy ike-policy {
  mode main;
  proposals ike-proposal;
}

gateway <gw name> {
  ike-policy ike-policy;
  version v2-only;  #For IKEv2 otherwise SRX defaults to IKEv1
}

**Palo Alto Firewalls®**

**ISAKMP/IKEv1 and IKEv2:**

**IPsec:**

```conf
[edit security ipsec]
proposal <proposal name> {
  protocol esp;
  authentication-algorithm [hmac-sha-384|hmac-sha-512]
  encryption-algorithm [aes256-cbc|aes256-gcm]
}
```

**Aruba®**

**ISAKMP/IKEv1 and IKEv2:**

```conf
crypto isakmp policy 1
  encryption aes256
  group 20
  version [v1|v2]
  hash sha2-384-192
```

**IPsec:**

```conf
crypto ipsec mtu <max-mtu> transform-set <transform-set-name> [esp-aes256|esp-aes256-gcm]
```
Apriva does not provide extensive documentation for configuring their devices online. The following configuration snippet was created using NIAP configuration guidance. Based on the documentation provided, the ISAKMP/IKE and IPsec configuration is co-located.

```
vpn-suite <suite name> copy suiteb-rsa{
   algorithm [AES-256|AES-GCM-256]
   algorithm ike sha2 [SHA-384|SHA-512]
   algorithm ipsec sha2 [SHA-384|SHA-512]
   group ike [16|20]
```

Appendix C: Security Association "show" Command Examples

This appendix lists several common vendors and the available commands to show ISAKMP/IKE and IPsec connection details. For the purpose of this appendix, only common vendors that provide the cryptographic algorithms negotiated are listed.

Cisco IOS Routers and ASAs:

ISAKMP/IKE:
show crypto isakmp sa detail

IPSEC:
show crypto ipsec sa

Juniper SRX:

ISAKMP/IKE:
show ike security-associations details

IPSEC:
show security ipsec security-associations detail

Palo Alto Firewalls:

ISAKMP/IKE:
show vpn ike-sa

IPSEC:
show vpn ipsec-sa

Aruba:

ISAKMP/IKE:
Aruba provides the following command to show ISAKMP SAs however it does not provide cryptography details

show crypto isakmp sa

IPSEC:
show crypto ipsec sa
Appendix D: Examples of ISAKMP/IKE Traffic Signatures

IPS Signatures for Obsolete Diffie-Hellman Groups (1, 2, or 5)

These signatures can be used to detect weak IKEv1 connections. From a defensive perspective, this can be used to identify VPN endpoints using obsolete Diffie-Hellman groups or to outright block these connections thereby ensuring policy compliance.

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE group detected"; content:"|00 00 00 00 00 00 00 00|"; offset: 36; depth: 8; content:"|80 02 00 01 80 04 00 01|"; within: 80; sid: 1; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE group detected"; content:"|00 00 00 00 00 00 00 00|"; offset: 36; depth: 8; content:"|80 02 00 01 80 04 00 02|"; within: 80; sid: 2; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE group detected"; content:"|00 00 00 00 00 00 00 00|"; offset: 36; depth: 8; content:"|80 02 00 01 80 04 00 05|"; within: 80; sid: 3; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE group detected"; content:"|00 00 00 00 00 00 00 00|"; offset: 36; depth: 8; content:"|80 02 00 02 80 04 00 01|"; within: 80; sid: 4; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE group detected"; content:"|00 00 00 00 00 00 00 00|"; offset: 36; depth: 8; content:"|80 02 00 02 80 04 00 02|"; within: 80; sid: 5; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE group detected"; content:"|00 00 00 00 00 00 00 00|"; offset: 36; depth: 8; content:"|80 02 00 02 80 04 00 05|"; within: 80; sid: 6; rev: 1;)
```

IPS Signatures for DES/3DES

These signatures can be used to detect devices attempting to use obsolete encryption.

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE DES Encryption Used"; content:"|00 00 08 01 00 00 02|"; offset:41; depth: 7; sid: 7; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE DES Encryption Used"; content:"|00 00 08 01 00 00 03|"; offset:41; depth: 7; sid: 8; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE DES Encryption Used"; content:"|00 00 08 01 00 00 09|"; offset:41; depth: 7; sid: 9; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE DES Encryption Used"; content:"|00 00 08 01 00 00 11|"; offset:41; depth: 7; sid: 10; rev: 1;)
```

```
alert udp $HOME_NET 500 -> $EXTERNAL_NET any (msg:"Obsolete IKE DES Encryption Used"; content:"|00 00 08 01 00 00 21|"; offset:41; depth: 7; sid: 11; rev: 1;)
```

IPS Signature of Anomalous ISAKMP/IKE Traffic

NSA has identified scanning activity that generates anomalous ISAKMP traffic. The following rule is designed to block that anomalous traffic.

```
alert udp any any -> any 500 (msg:"Anomalous ISAKMP"; content:"|00 00 00 00 00 00 00 00 21|"; offset: 8; content:"|03 00 00 0e 01 00 00 00 00|"; distance:16; sid: 12; rev:1;)
```
