1.0 Introduction

Aptim Federal Services, LLC (APTIM) is providing environmental remediation services to the U.S. Department of the Navy under the Environmental Multiple Award Contract, Contract No. N62473-12-D-2005, Task Order 0024. APTIM is performing air sampling at Hunters Point Naval Shipyard in accordance with the dust control plan (DCP) included in Appendix C of the *Final Remedial Action Work Plan, Parcel E Remedial Action—Phase 1, Hunters Point Naval Shipyard, San Francisco, California* (Work Plan; APTIM, 2019). The DCP describes procedures that minimize dust during work activities and requires air sampling to ensure these procedures are effective. The DCP helps prevent exposure of residents and construction crews to potential airborne chemicals of concern, and dust from the work area.

This summary report describes the following:

- Where and how air samples are collected
- What test methods are used to analyze air samples
- How air sampling data are evaluated

This summary report also presents the air sampling analytical results from November 20, 2019 through December 31, 2021 and compares the results with the established action levels included in the Work Plan (APTIM, 2019).

2.0 Sampling Site Locations

Air sampling stations were mobilized to collect air samples upwind and downwind of work areas for the duration of the project. The predominant wind direction at Hunters Point Naval Shipyard is from the west. Figure 1 shows locations of air sampling stations and wind direction. For the fieldwork conducted during this period, APTIM uses upwind and downwind sampling locations marked as “Air Sampling Station #1 B606 Upwind” near Crisp Road and “Air Sampling Station #2 12A Downwind” in Parcel D-1 near the Finger Piers (Figure 1). Air sampling is being performed to help ensure effective dust control. The locations of the air sampling stations were determined based on the prevailing wind direction and can be modified as needed. A windsock installed onsite is used to show wind direction and weather forecasts are checked daily at www.noaa.gov. Sampling stations remain stationary while sampling is being conducted. Each sampling station includes three separate air sampling systems for the following:

- Total suspended particulates (TSP) and for arsenic, lead, and manganese
- Particulate matter larger than 10 microns in size (PM10)
- Asbestos

3.0 Analytical Methods

TSP, Arsenic, Lead, and Manganese: TSP samples are collected with a high-volume (39 to 60 cubic feet per minute) air sampler in accordance with U.S. Environmental Protection Agency's (EPA's) reference sampling method for TSP, described in Title 40 Code of Federal Regulations, Part 50, Appendix B. Each sample is collected on a filter over an approximately 8-hour workday period; the filter is then weighed to determine the amount of TSP collected. Once the amount of TSP has been determined, the sample is analyzed for arsenic, lead and manganese in accordance with one of the IO-3 methods identified in the *Compendium of Methods for the Determination of Inorganic Compounds in Ambient Air* (EPA, 1999a). The equipment specifications and sampling procedures used, including the sampling apparatus, filters, equipment accuracy, equipment calibration, and quality assurance checks, all conform to those specified in the analytical method.

PM10: Air samples are collected and analyzed for PM10 in accordance with EPA's reference sampling method for PM10, described in 40 Code of Federal Regulations Part 50, Appendix J. Each sample is collected on a filter over an approximately 8-hour workday period; the filter is then weighed to evaluate the concentrations of PM10 in ambient air.

Asbestos: Air samples are collected and analyzed for asbestos in accordance with the National Institute for Occupational Safety and Health (NIOSH) Method 7400, in the *NIOSH Manual of Analytical Methods* (1994). NIOSH Method 7400 requires that samples be collected on three-piece cellulose ester filters, which are fitted with conductive cowlings, at a sampling rate of between 0.5 liter per minute and 16 liters per minute. NIOSH Method 7400 measures bulk fiber count in the filter and does not differentiate between asbestos and non-asbestos fibers. High total (bulk) fiber exceedances can be re-analyzed using the NIOSH Method 7402, which will identify and differentiate between asbestos and non-asbestos fibers via transmission electron microscopy.

5.13 Report 13

Due to temporary site shutdown and no earth moving activities from January 4 through January 29, 2021, perimeter air monitoring samples were not collected for PM10, TSP, or metals. Perimeter air monitoring samples for asbestos were collected during this period with the following exceptions; no samples were collected on January 4, 22, 27, and 28, 2021, due to rain. And, no samples were collected on January 18, 2021, due to the Martin Luther King Jr. holiday. Air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.14 Report 14

Due to temporary site shutdown and no earth moving activities from February 1 through 8 and February 12 through 26, 2021, perimeter air monitoring samples were not collected for PM10, TSP, or metals. Perimeter air monitoring samples for asbestos were collected during this period except on February 2,15, and 19, 2021, due to rain. Upwind asbestos data is not available for February 25 due to a damaged filter cassette. Air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.15 Report 15

Due to temporary site shutdown and no earth moving activities from March 1 through March 31, 2021, perimeter air monitoring samples were not collected for PM10, TSP, or metals. Perimeter air monitoring samples for asbestos were collected during this period with the following exceptions; no samples were collected on March 10 and 18, 2021, due to rain. Air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.16 Report 16

Due to temporary site shutdown and no earth moving activities from April 1 through April 30, 2021, perimeter air monitoring samples were not collected for PM10, TSP, or metals. Only perimeter air monitoring samples for asbestos were collected during this period. On April 20, the downwind Air Sampling Station #2-12A sample indicated a result of 0.114 fibers per cubic centimeter, slightly exceeding the 0.1 fibers per cubic centimeter action level. The sample was submitted to SGS Forensics for re-analysis, which confirmed a high bulk fiber count of 0.110 fibers per cubic centimeter. Because

the method being used (NIOSH Method 7400) measures bulk fiber count in the filter and does not differentiate between asbestos and non-asbestos fibers, the sample was also analyzed using the NIOSH Method 7402, which can identify and differentiate between asbestos and non-asbestos fibers via transmission electron microscopy. The result was an asbestos fiber concentration of 0.0006 fibers/cubic centimeter. This indicates that the elevated bulk result reported using NIOSH Method 7400 was due to impurities (non-asbestos fibers) in the sample, not asbestos fibers. It should be noted that on the day of the exceedance, there were no on-site activities being conducted and the daily average wind speed was 8.6 miles per hour and reached a monthly high of 30 miles per hour around 14:57, with the predominant wind originating from the west. All other air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.17 Report 17

Due to temporary site shutdown and no earth moving activities from May 3 through May 28, 2021, perimeter air monitoring samples were not collected for PM10, TSP, or metals. Only perimeter air monitoring samples for asbestos were collected during this period. Downwind asbestos data is not available for May 19 due to a damaged filter cassette. All other air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.18 Report 18

Due to temporary site shutdown and no earth moving activities from June 1 through July 2, 2021, perimeter air monitoring samples were not collected for PM10, TSP, or metals. Only perimeter air monitoring samples for asbestos were collected during this period except on May 31 due to a company holiday. On June 7, the downwind Air Sampling Station #2-12A sample indicated a result of 0.130 fibers per cubic centimeter, slightly exceeding the 0.1 fibers per cubic centimeter action level. The method used (NIOSH Method 7400) measures bulk fiber count in the filter and does not differentiate between asbestos and non-asbestos fibers, the sample was also analyzed using the NIOSH Method 7402, which can identify and differentiate between asbestos and non-asbestos fibers via transmission electron microscopy. No asbestos fibers were detected by the NIOSH Method 7402 with a result of <0.0022 fibers/cubic centimeter. This indicates that the elevated bulk result reported using NIOSH Method 7400 was due to impurities (non-asbestos fibers) in the sample, not asbestos fibers. All other air

sampling results during this sampling period were below the action levels identified in Table 4-1.

5.19 Report 19

Due to temporary site shutdown and no earth moving activities from July 6 through July 21, 2021, perimeter air monitoring samples were not collected for PM10, TSP, or metals. Only perimeter air monitoring samples for asbestos were collected during this period; with the exception of July 5 due to a company holiday. Since earth moving activities resumed on July 22, PM10, TSP, metals and asbestos samples were collected from July 22 to July 30. Air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.20 Report 20

Air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.21 Report 21

Air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.22 Report 22

Perimeter air samples were not collected on October 21, 22, 25 and 26 due to rain. All other air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.23 Report 23

Perimeter air samples were not collected on November 9 and 10 due to rain. Air samples were also not collected on November 25 and 26 due to Thanksgiving holiday. All other air sampling results during this sampling period were below the action levels identified in Table 4-1.

5.24 Report 24

Due to temporary site shutdown and no earth moving activities from December 13 through December 31, 2021, perimeter air monitoring samples were not collected for PM10, TSP, metals, or asbestos**.** All other air sampling results during this sampling period were below the action levels identified in Table 4-1.

Sample locations are shown on Figure 1.
Upwind station is located at Air Sampling Station #1; Downwind station is located at Air Sampling Station #2
Prevailing winds come out of the northwest
The action limits are as follows: TSP = 0.5 mg/m^3, arsenic = 10 $\mu g/m^3$, lead = 50 $\mu g/m^3$, manganese = 200 $\mu g/m^3$.
The detection limit for TSP is 0.06 $\mu g/m^3$ assuming a minimum sample volume of 1,600 m^3. The detection limits for arsenic, lead and manganese are 16 ng/m^3 assuming
J - the concentration is an estimated value
$\mu g/m^3$ - microgram per cubic meter
mg/m^3 - milligram per cubic meter
N/A - not applicable
ng/m^3 - nanogram per cubic meter
TSP - total suspended particulates

Notes:
Note 1: Sample not collected due to inclement conditions: Rain.
Note 2: Samples were not collected as project site was closed for holidays.
Note 3: Samples were not collected as no excavation was conducted.
Sample locations are shown on Figure 1.
Upwind station is located at Air Sampling Station #1; Downwind station is located at Air Sampling Station #2.

Prevailing winds come out of the northwest

The action Level for PM10; Cal/OSHA PEL = 5,000 µg/m^3

The detection limit for PM10 is 0.06 µg/m^3 assuming a minimum sample volume of 1,600 m^3.

µg/m^3 - microgram per cubic meter
N/A - not applicable
PM10 - particulate matter smaller than 10 microns in diameter

Attachment 1, Table 4: Asbestos Sampling Results

Notes:
Note 1: Sample not collected due to inclement weather conditions: Rain.
Note 2: Samples were not collected as project site was closed for holidays.
Note 3: Samples were not collected as no excavation was conducted.
Note 4: Filter cartridge damaged, no Asbestos result.
Note 5: Sample was re-analyzed using TEM due to high bulk fiber result exceeding action limit.

Sample locations are shown on Figure 1.
Upwind station is located at Air Sampling Station #1; Downwind station is located at
Prevailing winds come out of the northwest

The action limit for asbestos is 0.1 fibers/cm^3.
The detection limit is 0.003 fibers/cm^3 assuming a minimum sample volume of 900
< - less than
fibers/cm^3 - fibers per cubic centimeter

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. Limit of detection is 7 fibers/mm². Fiber counts outside the recommended fiber density range of the method (100-1300 f/mm2) have greater than optimal variability and are probably biased. Field blank results, when available, are used to blank correct results. NIOSH 7400 requires field blanks be submitted at a rate of 10%, with a minimum of 2 per set. Measurement of uncertainty available upon request. The results in this report meet all requirements of the NELAC standards unless otherwise noted.
Intra-laboratory Sr values: 5-20 fibers = 0.35, 21-50 fibers = 0.24, 51-100 fibers = 0.19. Inter-laboratory Sr values (Average of EMSL round robin data) = 0.34.

Receipt
The samples were received on 1/5/2022 10:00 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 22.0º C.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-210717 and analytical batch 570-210958 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Lab Admin
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Subcontract Work
Method Asbestos - Low Flow: This method was subcontracted to EMSL - LA Testing - Huntington Beach. The subcontract laboratory certification is different from that of the facility issuing the final report.

LA Testing maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by LA Testing. LA Testing bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. Limit of detection is 7 fibers/mm?. Fiber counts outside the recommended fiber density range of the method (100-1300 f/mm2) have greater than optimal variability and are probably biased. Field blank results, when available, are used to blank correct results. NIOSH 7400 requires field blanks be submitted at a rate of 10%, with a minimum of 2 per set. Measurement of uncertainty available upon request. The results in this report meet all requirements of the NELAC standards unless otherwise noted. Intra-laboratory Sr values: 5-20 fibers = 0.32, 21-50 fibers = 0.24, 51-100 fibers = 0.17. Inter-laboratory Sr values (Average of EMSL round robin data) = 0.34.
